

What is an effective way to enact change/transition towards a more 'sustainable' future?

Spread knowledge and change attitude

Increasing awareness about issues associated with the Human environment and its impacts (Social, environmental, economic, etc.)

How do you spread knowledge and change attitude?

Implementation and action- ideas and alternatives to move towards more sustainable culture must be implemented, prototyped showcased, etc. to build momentum and show real working models.

Scale must be considered: DIY simple solutions need to exist to engage communities at the grassroots level. People relate more to tangible, understandable media (Is this true?)

What are common areas that all people can relate, to put ideas/solutions into context?

Everyone eats, everyone shits, and everyone has shelter

How do my **interests** relate to these areas?

Eat->Food->**Agriculture**->**Urban**
Shit->**Waste**->**Composting**->**Nutrient Cycles**
Shelter->Materials->**Natural Building**->**Earth**

Water comes in contact with all these area (sketch systems model of water cycles as it flows through these areas?)

"Share food and simple sustainable technologies"

"Build new structures that can support meaningful work and dignified lives"
